App-Only Install

Updated: Nov 4, 2025

You can configure Embedded Signup so that only [business tokens](#) can be used to access assets owned by customers onboarded via the flow. This approach offers enhanced security by reducing risk associated with [system tokens](#), flexibility in simplifying onboarding for other Meta assets, and scalability to support a larger number of onboardings. By using a granular token, you can also reduce the negative impact in case of a compromised token, making it a more secure and efficient way to manage your business customer assets.

Note that App-Only Install can't be used to [onboard WhatsApp Business app users](#).

Revision #3
