

Calling API App Review Guidelines | Developer Documentation

Calling API App Review Guidelines

Updated: Nov 21, 2025

Overview

The official page referenced by reviewers is [/docs/permissions#w](#). Use this guide as complementary to that page but treat that page as the official source when in doubt. This page provides details to improve your chances of a successful App Review specifically for WhatsApp Business Calling API features.

Guidelines

For the WhatsApp business management permission

You should clearly show that your application can enable and disable calling features by displaying whether the Call Button icon is visible.

Do this by enabling and disabling calling features, not simply toggling Call Button icon visibility.

[Learn how to enable and disable Calling API features via API](#)[Learn how to enable and disable Calling API features in WhatsApp Manager](#)

For the WhatsApp business messaging permission

You should clearly demonstrate your application can support **either of the following use cases**:

Use case 1: Place a business-initiated call

Share a video of you using your application to place a business-initiated call. Then display a user accepting the call on a WhatsApp mobile client.

Use case 2: Receive a user-initiated call

Share a video of a user placing a call to your business phone number. Then show your application receiving the incoming call.

Show either:

The incoming call in the WhatsApp client application UI. The calling webhook as delivered to your application.
