## Webhooks for Groups API

Updated: Feb 11, 2026

In order to receive webhook notifications for metadata about your groups, please subscribe to the following webhook fields:

`group_lifecycle_update` `group_participants_update` `group_settings_update` `group_status_update`

### `group_lifecycle_update` webhooks

A `group_lifecycle_update` webhook is triggered when a group is either created or deleted.

Group create succeed

Group create fail

Delete group succeed

Delete group fails

### `group_participants_update` webhooks

A `group_participants_update` webhook is triggered when a WhatsApp user joins a group with an invite link, requests to join a group, cancels their request, or when one or more join requests are approved.

User joined group using invite link succeed

## User accepts or cancels join request

**For join requests:** `GROUP_REQUEST_TYPE` is set to `group_join_request_created`. **For cancel requests:** `GROUP_REQUEST_TYPE` is set to `group_join_request_revoked`.

## Group participant remove succeed

## Group participant remove with participants partially fails

## Group participant remove fails

## Group participant leaves webhook

This webhook is sent when a group participant leaves the group. The `initiated_by` field and only the `wa_id` in the `removed_participants` list will point to the participant who left the group.

## `group_settings_update` webhooks

### Group settings update succeed

### Group settings update partial fail

### Group settings update total fail

## `group_status_update` webhooks

WhatsApp uses advanced machine learning technology to evaluate group information including group subjects, profile photos, and group descriptions. We also provide simple options for users to make reports to us from any chat.

We may prevent further activity in chat groups to comply with our legal obligations. We may also prevent further chat activity when a group admin is in violation of our [Terms of Service?](#)

You may receive a webhook if a group you manage is suspended. You may also receive a webhook if a suspended group you manage becomes clear of suspensions.

## Group suspended

## Group suspension cleared

# Group Message Status Webhooks

When you send messages to a group, you will receive a status webhook when the message is sent, delivered, and read. Instead of sending multiple webhooks for each status update, we may send an aggregated webhook.

There are two types of aggregated message status webhooks you can receive.

## Multiple Participants, Single Message

If you send a message and are set to receive several `read` or `delivered` statuses from participants, we will send you a single, aggregated webhook that contains multiple `status` objects.

Each webhook you receive will be in reference to a single message sent to a single group and a single status type, i.e single group, single status by multiple participants for a single message.

## Group message delivered

## Pricing information

Status messages webhooks that contain pricing information will have:

`CONVERSATION_CATEGORY` set to one of: `group_marketing` - Indicates a marketing conversation.

`group_utility` - Indicates a utility conversation. `group_service` - Indicates a service conversation.

`IS_BILLABLE` set to one of: `true` - Indicates a billable conversation. `false` - Indicates a non-billable conversation. `PRICING_MODEL` set to `PMP`.
